

Every day at AbbVie, we strive to make a remarkable impact on the lives of our patients. We seek innovative ways to improve the health of patients, operate responsibly, be stewards of the environment, and actively engage in the communities where we work and live.

Climate Change – AbbVie Position

AbbVie recognizes the risks posed by global climate change. The effects of climate change are detrimental to global health and they pose a real threat to all communities, including the ones where we live and work.

AbbVie supports the intentions of international agreements and frameworks for addressing climate change. AbbVie believes the private sector has a responsibility to address climate change, and we will strive to implement energy efficiency programs and source renewable energy at our global facilities to help deliver on the intent of these agreements.

AbbVie strives to improve the lives of people around the world and we will contribute to the achievement of the agenda set by the United Nations in the Sustainable Development Goals (SDGs). AbbVie is committed to promoting a sustainable supply chain (SDG 12) and promoting climate action (SDG 13).

AbbVie is advancing the long-term sustainability of our operations by reducing the energy we consume, reducing the water we consume, and reducing the waste we generate.

AbbVie aims to reduce our carbon footprint as part of our overall commitment to operating responsibly. AbbVie seeks to voluntarily reduce our reliance on fossil fuels and increase sourcing of renewable energy whenever it is technically and economically feasible. We have established absolute reduction goals, and we invest in technology and infrastructure to reduce our carbon footprint accordingly.

AbbVie reports environmental data with transparency, and measure our progress in reducing our carbon footprint. We report our data using internationally recognized protocols, and we report our data in a public, timely way.
